## PACK DE TENSÍOMETRO Y ESTETOSCOPIO ES

### Aviso:

Al aviso usuario y/o paciente: cualquier incidente grave que haya ocurrido en relación con el producto debe comunicarse al fabricante y a la autoridad competente del Estado Miembro en el que está establecido el usuario y/o el paciente.

### Datos técnicos:

\*Este tensíometro cumple con la normativa EN1060-1/2.

\*La graduación del manómetro es de 2mmHg.

\*La precisión de la medición es de ±3mmHg.

\*El rango de medición es de 0-300mmHg.

\*El valor mínimo de la escala es 0. Si la aguja del manómetro se encuentra en la posición "0", deberá estar dentro del rango de tolerancia de ±3mmHg.

El tensíometro aneroide TA-01 es resistente y fácil de transportar. Garantiza la máxima fiabilidad tanto a nivel profesional como particular.

Los dispositivos MOBICLINIC cumplen con la normativa vigente según la Directiva EU93/42 sobre aparatos médicos.

### Cómo llevar a cabo la medición:

- Coloque el brazalete en uno de sus antebrazos. Asegúrese de que el borde inferior quede uno o dos centímetros por encima del codo.

- Cierre el brazalete de forma que la marca quede en contacto con la arteria y la membrana del diafragma esté sobre la parte interna del bíceps.

- Para una medición óptima, la membrana deberá quedar sobre la arteria. Es importante, además, que el paciente doble ligeramente el brazo, lo apoye sobre una superficie plana y relaje los músculos.

- Compruebe que la válvula de desinflado situada en la bomba es cerrada. Para ello, girela en sentido contrario a las agujas del reloj. Posicione la campana del estetoscopio bajo el brazalete y colóquese las olivas en los oídos. A continuación, comience la medición; para ello, infle el brazalete al máximo, hasta los 20-30mmHg.

- Abra ligeramente la válvula de descarga girándola en el sentido de las agujas del reloj y suelte el aire de la manera más uniforme posible, a una velocidad de

2-3mmHg por segundo.

- Cuando la presión del brazalete sea inferior al pico de la presión arterial, percibirá a través del estetoscopio los sonidos de Korotkoff de cada pulsación.

- Cuando perciba el primer sonido, el valor que aparece en la escala del manómetro corresponderá a la máxima (sistólica). Escuche atentamente para percibir el último ruido, que corresponderá, en la escala del manómetro, a la mínima (diástólica).

- Una vez determinados los valores de la presión, libere del todo el aire del brazalete. Si el resultado de la medición es incierto, repita la operación después de 10-15 minutos.

### Advertencias:

- Evite que el dispositivo reciba golpes.

- No inflle el brazalete por encima de 300mmHg.

- Evite que las partes de plástico entren en contacto con objetos cortantes o punzantes.

- No exponga el dispositivo a temperaturas extremas.

### Mantenimiento y cuidado:

- Se recomienda comprobar el estado del dispositivo cada dos años. Si detecta variaciones superiores a las que se indican en la información técnica, deberá calibrarse de nuevo.

- Para limpiarlo, utilice un paño suave y limpicio, mojado en alcohol.

- No sumerja el dispositivo en líquidos detergentes.

- No lo esterilice sometiéndolo a calor.

## SPHYGMOMANOMETER AND STETHOSCOPE PACK EN

### Notice:

Notice to the user and/or patient: any serious incident that has occurred in relation to the device must be reported to the manufacturer and to the competent authority of the Member State where the user and/or patient is established.

### Technical data:

\*Built to EN1060-1/2 standards.

\*Scale grading: 2mmHg.

\*Measurement precision: 0-300mmHg.

\*Measurement scale value that corresponds to the maximum (or systolic) pressure. Listen carefully and when you hear the last tone; read the value on the pressure gauge scale; this is the minimum (or diastolic) pressure.

- After reading the pressure values, let all the air out of the cuff, if the reading is doubtful, repeat the operation after allowing 10-15 minutes to elapse.

heard at every beat through the stethoscope.

- When you heard the first one, read on the pressure gauge scale the value that corresponds to the maximum (or systolic) pressure. Listen carefully and when you hear the last tone; read the value on the pressure gauge scale; this is the minimum (or diastolic) pressure.

- After reading the pressure values, let all the air out of the cuff, if the reading is doubtful, repeat the operation after allowing 10-15 minutes to elapse.
